

[0028]

A dolly for transport of a rectangular member, such as a basket. The dolly is formed from corner members made of plastic material and having essentially hollow interiors to maintain a lightweight assembly. The corner members are interconnected by standard tubular members. The corner members are made of an upper and lower half element each having a channel therein so that when connected form a pathway for receiving the tubular members. The upper half element has an exposed surface for receiving a corner portion of the rectangular member to minimize shifting and other movement of the rectangular member.
